

The Smart Heart

Charlotte Kooima, RDN, LD, LN
CK Consulting, Inc
Iowa ANFP March 29, 2019

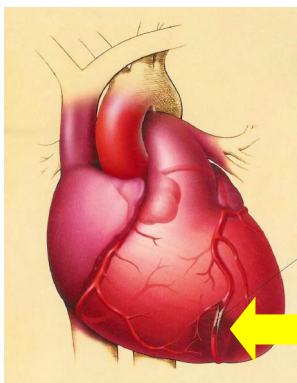

The Heart at Work

- Your heart beats an average of 115,000 beats per day
- Your heart has its own electrical system which can power a truck to drive 20 miles every day
- If you stretch out your blood vessels, they would cover approximately 60,000 miles
- Your heart pumps up to 2,000 gallons of blood per day
- Your blood travels approximately 12,000 miles every day – that's 4 times across the US
- The pressure in your arteries can project blood up to 30 feet
- In the average lifespan, your heart will pump 1.5 million barrels of blood - that's enough to fill 200 train tankers
- You would have to leave on the kitchen faucet on for 45 years to be equivalent to the amount of blood pumped for a lifetime

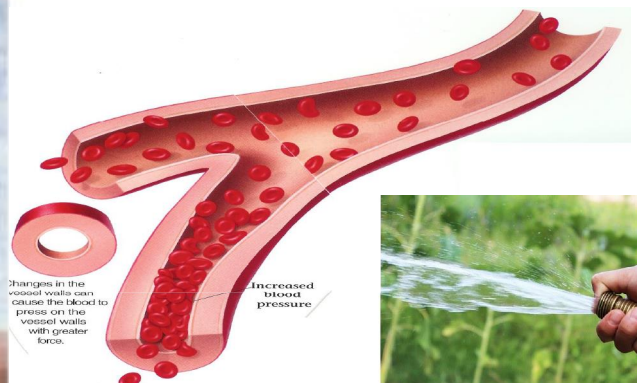

Understanding the Heart

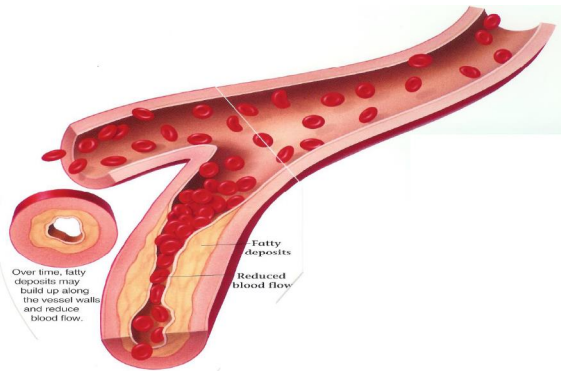

- Over time, excess fat & cholesterol build up in the arteries
- This reduces blood flow and may cause vessel damage

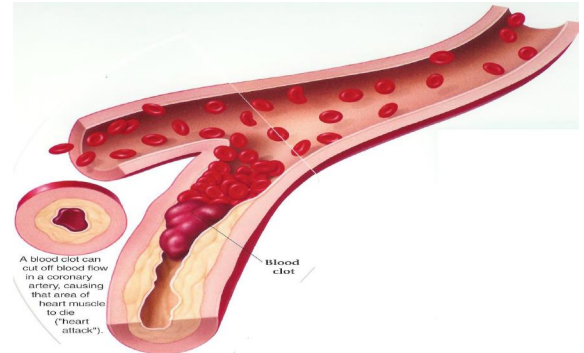

Slow Damage to Vessels

Continued Damage and Build Up

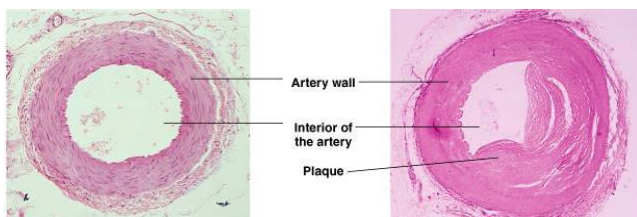

Heart Attack from Blockage

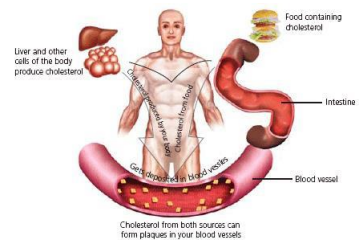

Cardiovascular Disease

Cross-section of a normal artery and a partially blocked artery

What is Cholesterol?

- Fat produced naturally by our body
- Found in food
 - Americans consume 275-700 mg average
- Our body requires cholesterol to function properly
- Essential nutrients
 - Provide energy
 - Help transport fat-soluble nutrients throughout the body
- Contribute greatly to the flavor and texture of food

What Are Lipids?

Non-Essential

- Bodies CAN make
- Saturated
- Omega-9

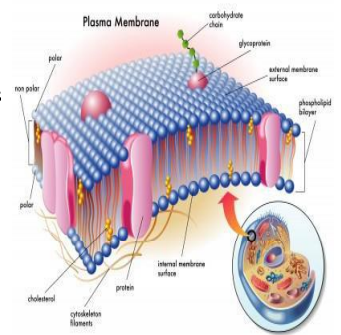

Essential

- Bodies can NOT make
- Omega-6 linoleic
- Omega-3 alpha-linolenic
- Deficiency is rare
 - TPN pts
 - Severe fat malabsorption

Functions of Lipids

Cell membranes

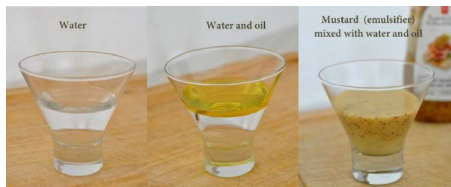

- Double layer of phospholipids
- Selectively allow both fatty and water-soluble substances into the cell
- Store fatty acids temporarily
- Protects nerve cells

Function of Lipids

Emulsifiers (lecithin)

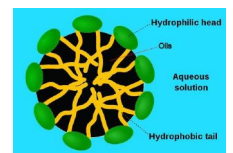

- Lecithin used as an emulsifier to combine two ingredients that don't ordinarily mix, such as oil and water
- Allows ingredients in salad dressing to mix well and remain mixed

Lipids in the Body

Lipid transportation and absorption

- Micelles
 - Water-soluble globules with a fatty core
 - Carry monoglycerides and long-chain fatty acids to microvilli
- Chylomicron
 - Deliver dietary lipids from intestines to cells and liver
- Lipoprotein
 - Transport lipids in the lymph and blood

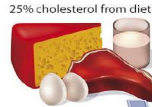

Lipids in the Body

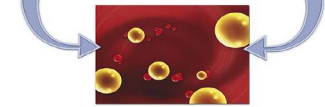

Digestion and absorption

- Body absorbs about 50 percent of dietary cholesterol
- Dietary fat increases absorption
- Plant sterols and dietary fiber decrease absorption

75% cholesterol made by the body

25% cholesterol from diet

Fatty Acids Are Key Building Blocks

Saturation

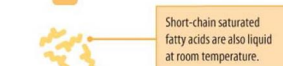

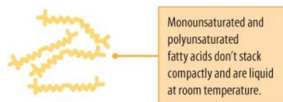

- **Saturated fatty acid**
 - When all bonds between carbon atoms in a chain are single bonds
- **Unsaturated fatty acid**
 - When one or more bonds between carbon atoms is a double bond
- **Monounsaturated fatty acid**
 - When there is one carbon-carbon double bond
- **Polyunsaturated fatty acid**
 - When there is more than one carbon-carbon double bond

Fatty Acids Are Key Building Blocks

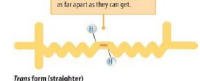

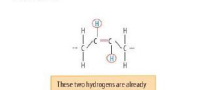

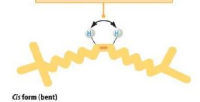

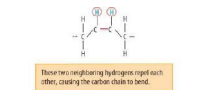

Chain length of Fatty Acids

- Long Chain
- Medium Chain
- Short Chain
 - Shorter fatty acids remain liquid at room temperature and even with refrigeration
 - Shorter fatty acids also are more water-soluble

Fatty Acids Are Key Building Blocks

- **Cis vs. trans**
 - Unsaturated fatty acids can vary in shape
- **Cis fatty acids**
 - Chain is bent
 - Occur naturally
- **Trans fatty acids**
 - Chain is straighter
 - Produced by hydrogenation
 - Resemble saturated fatty acid

Trans Fats in the Nutrition Facts

Nutrition Facts	
Serving Size 1 oz.	
Amount Per Serving	Calories from Fat 90
Calories 150	% Daily Value*
Total Fat 10g	16%
Saturated Fat 1g	6%
Unsaturated Fat 4.5g	
Trans Fat 0g	
Cholesterol 0mg	0%
Sodium 160mg	7%
Potassium 330mg	9%
Total Carbohydrate 15g	5%
Dietary Fiber 1g	4%
Sugars 0g	
Protein 2g	
Vitamin A 0%	Vitamin C 10%
Calcium 0%	Iron 2%
Vitamin E 6%	Thiamin 2%
Niacin 6%	Vitamin B6 4%
Phosphorus 4%	Magnesium 4%

* Percent Daily Values are based on a diet of other people's secrets.

Calories	2,000	2,000
Total Fat	Less than 65g	80g
Sat. Fat	Less than 25g	25g
Cholesterol	Less than 300mg	300mg
Sodium	Less than 2,400mg	2,400mg
Potassium	Less than 3,500mg	3,500mg
Total Carbohydrate	300g	375g
Dietary Fiber	25g	30g

Fat 9 • Carbohydrate 4 • Protein 4

Ingredients: Potatoes, Sunflower Oil and/or Corn Oil, and Salt. No Preservatives.

Fatty Acids Are Key Building Blocks

- The omega-3 fatty acids
 - Alpha-linolenic acid elongated and desaturated to EPA and DHA
 - Dilate blood vessels, discourage blood clotting, and reduce inflammation
 - Reduces triglycerides
 - Improves cholesterol
- American Heart Association recommends 2 servings per week

Recommended Omega 3 Intake

- Patients without documented coronary heart disease (CHD)
 - Twice a week
- Patients with documented CHD
 - 1 g of EPA+DHA per day
 - EPA+DHA in capsule form could be considered
- Patients who need to lower triglycerides
 - 2 to 4 grams of EPA+DHA per day provided as capsules under a physician's care

Fish

- Fatty fish
 - Mackerel
 - Lake trout
 - Herring
 - Sardines
 - Albacore tuna
 - Salmon
 - eicosapentaenoic acid (EPA)
 - docosahexaenoic acid (DHA)

Nuts

- Walnuts
 - Omega 3 Fatty Acids
- Almonds
 - Monounsaturated fats
- Portion Size
- Mixed nuts

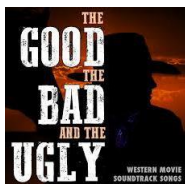

Fatty Acids Are Key Building Blocks

- The omega-6 fatty acids
 - Linoleic acid = main dietary omega-6 fatty acid
 - Elongation/desaturation steps convert linoleic acid to arachidonic acid
 - These constrict blood vessels, promote blood clotting, and promote inflammation

Types of Cholesterol

- **LDL Cholesterol (Bad):** Low Density Lipoprotein
- **HDL Cholesterol (Good):** High Density Lipoprotein
- **Triglycerides (Ugly):** Triglycerides are produced by the breakdown of certain sugars and visible animal fat consumed in your diet. Triglycerides are stored as body fat

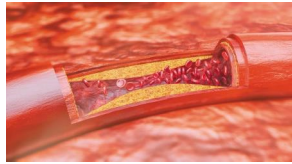

Good Cholesterol

- HDL – High Density Lipoprotein
- Contains very little cholesterol
- Removes LDL “bad” cholesterol from blood stream
- HDL can be increased with exercise
- This lipoprotein attaches to the LDL (bad) cholesterol and removes it from the blood stream. This can help prevent the build up of plaque and reduce your risk of heart attack or stroke.

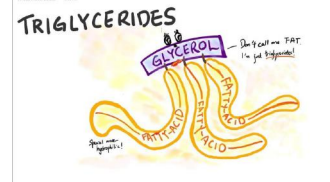

Bad Cholesterol

- LDL – Low Density Lipoprotein
- Majority is cholesterol
- Builds up in arteries
- Helps make up the plaque-like substance
- Main focus of the ATP-III study – need to lower this level
- Plaque can cause a blockage leading to a heart attack or stroke

The Ugly

- Triglycerides are stored as body fat for energy
- Commercial processing of fats
 - Removes phospholipids, plant sterols, and other phytochemicals
 - Further processing increases trans fatty acids
- Reduces waste, prevents spoilage, increases availability of calorie-rich oils

Monounsaturated Fats

- Liquid at room temperature
- Will start to thicken under refrigeration
- Sources: olive, canola, almond, peanut oils
- Lower LDL and protect HDL

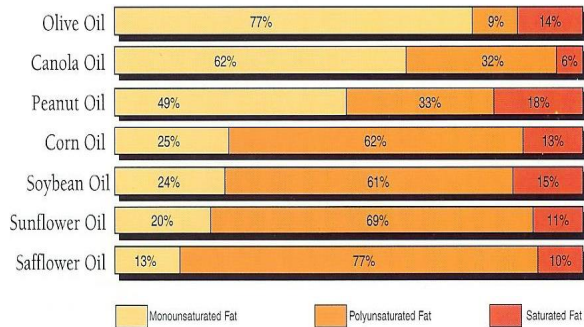

Polyunsaturated Fats

- Liquid at room temperature and remain liquid under refrigeration
- Sources: corn, soybean, safflower, sunflower
- Lower LDL and may reduce HDL if used in large quantities

Visual Comparison of Fats

Vegetable Oil Fat Comparison

Example of Trans Fat Free & Olive oil Blend

Plant Based Spreads

- Sterols come from soybeans
- Stanols come from other plant sources
- compete with the body's ability to absorb cholesterol
- Best used if taken approximately 3 servings per day
- Studies indicate patients already on lipid lowering medications have enhanced benefits

Why the Confusion?

1912- Nikolai Anichkov

- Rabbits showed atherosclerosis after feeding on cholesterol

- What do RABBITS EAT?

- 2009 – Robin Leasing restudied all findings and proved Keys' study to be invalid.

- Pure White and Deadly, citing sugar as the culprit for many diseases including heart disease

A photograph of two trees with dense red foliage, positioned side-by-side to form a heart shape. The trees are set against a clear blue sky.

- [illegible]

Diet Principals

- Weight loss is recommended to reduce blood pressure in adults with elevated blood pressure or hypertension if you are overweight or obese

A 1-kg (2.2 pounds) reduction in body weight will drop blood pressure

- The DASH (Dietary Approaches to Stop Hypertension) diet will help weight loss and lower blood pressure
- Sodium reduction is recommended for adults (50 years and younger) with elevated blood pressure or hypertension

Optimal goals:

<1500 mg/d for 50 years and younger with hypertension

2300 mg for the general population

If you can not achieve the above, reduce at least a 1000-mg/day from your normal intake

Diet Principals

- Your diet should be rich in potassium, unless you have chronic kidney disease (CKD) or use drugs that affect potassium levels

Goal: 3500–5000 mg/d

- Your exercise program is essential for the body to run more efficiently and help reduce body weight and blood pressure

Aerobic (high intensity) 90–150 min/week

Dynamic resistance (sit ups, push ups) 90–150 min/week

Isometric resistance (yoga) 3 sessions/week

- If you drink alcohol and have high blood pressures, it is recommended to drink no more than 2 (men) and 1 (women) standard drinks per day

Avoid Sodium

- Found naturally in food
- Processing or shaking it on
- Required for our body to function properly
- Too much causes high blood pressure
- Choose “low or reduced” sodium, or “no salt added” versions of foods and condiments when available.
- Choose fresh, frozen, or canned (“low or reduced sodium” or “no salt added”) vegetables.
- Use fresh poultry, fish, and lean meat, rather than canned, smoked or processed types.
- Choose ready-to-eat breakfast cereals that are lower in sodium.
- Limit cured foods (such as bacon and ham), foods packed in brine (such as pickles, pickled vegetables, olives, and sauerkraut); and condiments (such as mustard, horseradish, ketchup, and barbecue sauce)
- Cook rice, pasta, and hot cereals without salt. Cut back on instant or flavored rice, pasta, and cereal mixes, which usually have added salt.

Avoid Sodium

Choose “convenience” foods that are lower in sodium. Cut back on frozen dinners, mixed dishes such as pizza, packaged mixes, canned soups or broths, and salad dressings—these often have a lot of sodium.

- Rinse canned foods, such as tuna and canned beans, to remove some of the sodium.
- Use spices instead of salt. In cooking and at the table, flavor foods with herbs, spices, lemon, lime, vinegar, or salt-free seasoning blends. Start by cutting salt in half.
- On Nutrition Labels aim for foods that are less than 5% of the daily value of sodium. Foods with 20% or more daily value of sodium are considered high.

- Choose “convenience” foods that are lower in sodium. Cut back

Functional Foods

- Specific functions either added to or found naturally in foods.
- Plant sterols or stanols
- Naturally occurring phytochemicals found in many fruits, vegetables, nuts and cereals.
- Similar to structure to cholesterol
- Fight for absorption with cholesterol causing the body to absorb the sterol or stanol instead
- Reduces the amount of bad cholesterol found in your blood
- 2 grams per day to help lower LDL

SmartBalance® Heart Right Fat Free Milk, (Cow's Milk) 8oz	0.40 grams

PROMISE ACTIV™ SUPERSHOTS™

Fiber

- 90% Americans do not get enough fiber
- Eating approx 30g fiber daily can decrease heart attacks by 40%
- Most Americans eat 5g or less per day
- National Academy of Sciences
 - Recommends 25g for women 19-50, 21g for women 50+, 38g for men 19-50 and 30g for 50+

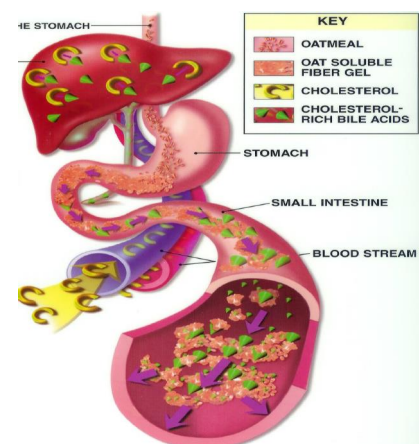

Fiber

- Insoluble fiber
 - fiber provides bulk
- Soluble fiber
 - Turns into a gel when exposed to water
 - Attaches to LDL (bad) cholesterol from the blood stream
- The goal is to consume 5-10 grams per day.

Food Sources	Grams
Peanut Butter, 1 Tbsp	0.3
Cheerios®, 1 cup	1.0
Kashi® Heart to Heart cereal, 1 cup	1.0
Flaxseed, 1 Tbsp	1.1
Oat flakes, 1 cup	1.5
Asparagus, ½ cup	1.7
Oranges, 1 small	1.8
Apricots, 4 with skin	1.8
Sweet Potato with skin	1.8
Brussels sprouts, ½ cup	2.0
Cooked oat bran cereal, ½ cup	2.2
Oatmeal, regular or steel cut, ½ cup dry	3.0
Beans (e.g. navy, kidney, black), 1 cup	4.0-4.8

The Magic of Soluble Cholesterol

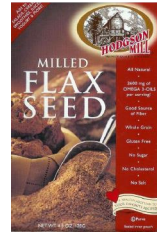

Soy Products

- 25g of soy protein a day
- Soy milk, tofu, tempeh
- Shown to reduce cholesterol
- Phytochemicals : prostate cancer, breast cancer, bone health, cognitive function

Flax Seed

- Contains Omega 3 fatty acids (alpha – linolenic acid)
- Good fiber source – both soluble and insoluble
- Phytochemicals – lignans
- Ground flax vs. flax pills or oils (no lignans)

Lipid Level Recommendations

- Total cholesterol – less than 200
- LDL (bad cholesterol) – less than 100
- HDL (good cholesterol) – greater than 60
(less than 40 is a single risk factor)
- Triglycerides – less than 150
- Blood pressure – 120/80 (less than)

Summary

- Not all fat is created equal
- The heart is a muscle – use it or lose it
- Give your arteries TLC – reduce pressure
- All foods still fit
- Use functional foods to benefit your heart
- Keep active
- You are what you eat
