

Management Math and Formulas

by Susan Davis Allen, MS, RD, CHE

Management Math	Formula	Example
Edible Yield Factor Used to calculate edible yield from produce or meat	$\text{Edible portion (EP)} \div \text{As purchased (AP)}$	16 lbs. of broccoli (AP) after cleaning yield 13 lbs. (EP) $13 \div 16 = 81\%$ yield
FTE Full-Time Equivalent	$\text{One person @ 8 hrs./day} \times 5 \text{ days/wk.} \times 52 \text{ wks./yr.} = 2,080 \text{ hrs}$	If you have six employees who work full-time, you have 6 FTEs; if you have 10 employees, two work full-time, two work 3/4 time, and six work 1/2 time, how many FTEs are there? $2 \times 1 \text{ FTE} = 2 \times 2,080 = 4,160 \text{ hours}$ $2 \times .75 \text{ FTE} = 1.5 \times 2,080 = 3,120 \text{ hours}$ $6 \times .5 \text{ FTE} = 3 \times 2,080 = 6,240 \text{ hours}$ Total FTEs = $6.5 \times 2,080 = 13,520 \text{ hours}$
Inventory Valuation The value of all of your inventory	$\text{Number of purchase units on hand} \times \text{product price, then added together}$	In a cooler: $1 \text{ bag lettuce} \times \$8/\text{bag} = \$8.00$ $10 \text{ lbs. carrots} \times .39/\text{lb.} = \3.90 $25 \text{ lbs. onions} \times .25/\text{lb.} = \6.25 Inventory Valuation = \$18.15
Productivity Rate Used to measure the productivity of foodservice employees	$\text{A measure of work such as trays assembled} \div \text{measure of time}$	14 trays assembled in seven minutes $14 \div 7 = 2 \text{ minutes/tray}$
Recipe Cost Used to determine the cost of a standardized recipe	$\text{List of ingredients with price per amount of ingredient, added together} \div \text{by the recipe yield} = \text{price per portion}$	Recipe: Scrambled Eggs for 12 clients: $18 \text{ eggs @ } \$1.50/\text{doz.} (\$1.50 \div 12 = \$.125/\text{egg})$ $18 \times .125 = \mathbf{\$2.25 \text{ for 18 eggs}}$ $1/4 \text{ cup milk @ } \$4.00/\text{gal} (16 \text{ cups/gal and four } 1/4 \text{ cups/cup})$ $\$4.00 \div 16 = \$.25/\text{cup} \div 4 = \mathbf{\$.0625 \text{ for } 1/4 \text{ cup milk}}$ Total cost/client = $\\$2.25 + .0625 = \\$2.31 \div 12 = .19/\text{client}$
Scaling a Recipe Used when increasing or decreasing the amount a recipe serves	$\text{Divide the New yield by the Original yield. Remember it by the fact that 'N' comes before 'O' in the alphabet so the formula is always } N \div O \text{ to get the conversion factor. Then multiply the ingredients in the recipe by the conversion factor.}$	Let's use the Scrambled Eggs above. You want to increase this recipe to serve 50 people. 1. Determine the conversion factor: $50 \div 12 = \mathbf{4.167}$ 2. Multiply that by each ingredient: $18 \text{ eggs} \times 4.167 = \mathbf{75 \text{ eggs}}$ $.25 \text{ cup milk} \times 4.167 = \mathbf{1 \text{ cup milk}}$

Management Math	Formula	Example								
Tray Accuracy Used to determine the number of errors in assembling trays	<ol style="list-style-type: none"> Count the total numbers of items on the menu ticket Count the number of errors you discover on one tray Divide the number of errors by the total number of items 	For today's noon meal, there are seven items, including drink and condiments. You discover two errors. $2 \div 7 = .29 \times 100 = 29\%$								
Monthly Food Cost Used to determine food cost for the month	<ol style="list-style-type: none"> Record beginning inventory valuation Add total purchases for the month Subtract ending inventory valuation 	For the month of June: <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 80%;">1. Inventory valuation as of June 1:</td> <td style="text-align: right;">\$7,456</td> </tr> <tr> <td>2. Purchases for the month of June:</td> <td style="text-align: right;">+ \$10,914</td> </tr> <tr> <td>3. Subtract ending inventory on the 30th -</td> <td style="text-align: right;">\$9,002</td> </tr> <tr> <td style="border-top: 1px solid black;">Monthly Food Cost:</td> <td style="text-align: right; border-top: 1px solid black;">\$9,368</td> </tr> </table>	1. Inventory valuation as of June 1:	\$7,456	2. Purchases for the month of June:	+ \$10,914	3. Subtract ending inventory on the 30th -	\$9,002	Monthly Food Cost:	\$9,368
1. Inventory valuation as of June 1:	\$7,456									
2. Purchases for the month of June:	+ \$10,914									
3. Subtract ending inventory on the 30th -	\$9,002									
Monthly Food Cost:	\$9,368									
Monthly Food Cost Percent A percentage used to track food costs and may be used to determine meal prices	<ol style="list-style-type: none"> Record the monthly food cost Divide by the sales for the month (or the raw food cost PPD x number of clients) 	<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 80%;">June monthly food cost</td> <td style="text-align: right;">\$9,368</td> </tr> <tr> <td>Sales for the month:</td> <td style="text-align: right;">\$27,398</td> </tr> </table> Food cost % for June: $\$9,368 \div \$27,398 = .342 \times 100$ or 34.2%	June monthly food cost	\$9,368	Sales for the month:	\$27,398				
June monthly food cost	\$9,368									
Sales for the month:	\$27,398									
Turnover Rate Used as a measure of stability in the foodservice department	<ol style="list-style-type: none"> List the number of employees who have left over a defined period of time Divide this by the total number of positions you have 	Turnover rate for 2015: <ol style="list-style-type: none"> 12 employees left the department in 2015 The total number of positions is 99 $12 \div 99 = .12 \times 100 = 12\%$ 								
Raw Food Cost (PPD) Per Patient Day Used as a financial measurement for tracking and benchmarking	$\left[\frac{\text{Monthly Food Cost}}{\text{total days in the month}} \div \text{total clients} \right]$	June monthly food cost $\left[(\$9,368 \div 30 \text{ days}) \div 74 \text{ clients} \right] = \$4.22/\text{day}$								
Raw Food Cost Per Meal The cost of the raw ingredients to produce a meal	$\left[\frac{\text{Monthly food cost from above}}{\left(\frac{\text{the number of meals served in the month, for example: the client count} \times 3 \text{ meals a day} \times (30 \text{ days}) \right)} \right]$	June monthly food cost: $\left[\$9,368 \div \left((74 \text{ clients} \times 3 \text{ meals}) \times 30 \text{ days} \right) \right] = \text{Cost Per Meal}$ $\left[\$9,368 \div \left((222 \text{ meals}) \times 30 \text{ days} \right) \right] = \text{Cost Per Meal}$ $(\$9,368 \div 6,660 \text{ meals}) = \1.41 Per Meal								
Meals Per Labor Hour Used as a measure of productivity and for tracking and benchmarking	$\text{Total meals served} \div \text{total hours worked (Note: total meals served includes regular meals plus any catering)}$	June meals: <ol style="list-style-type: none"> Regular meals = 6,660 meals Catered meals = 154 Total Meals: $6,660 + 154 = 6,814$ meals Use a total of 485 labor hours $6,814 \text{ total meals} \div 485 \text{ total labor hours} = 14 \text{ Meals Per Labor Hour}$ 								

Management Math	Formula	Example
<p>Labor Cost Per Meal Served</p> <p>Used as a financial measurement for tracking and benchmarking</p>	Total labor costs ÷ total meals served	<p>Using the example from above for total meals: (6,814)</p> <p>Total labor costs for June: \$6,305</p> <p>$6,305 \div 6,814 = \\$0.93/\text{meal}$</p>
<p>COLA Adjustment</p> <p>Calculating budget increase for COLA (cost of living adjustment)</p>	<ol style="list-style-type: none"> 1. Current budget x proposed cost of living adjustment percentage 2. Current budget + figures from above = proposed budget increase 	<p>Proposed COLA is 3.4%. Current labor budget is \$78,650 per month.</p> <p>$\\$78,650 \times .034 = \\$2,674$</p> <p>$\\$78,650 + \\$2,674 = \\$81,324$ for next month that includes adjustment for COLA</p>

Frequently Used Conversions

<p>How to Calculate Percentages</p>	<p>Cross multiply and divide</p> <p>June monthly food cost \$9,368</p> <p>Sales for the month: \$27,398</p>	<p>Food cost % for June:</p> <p>$\frac{\\$9,368}{\\$27,398} = [(9,368 \times 100) \div 27,398] = 34.2\%$</p> <p>? 100</p>
<p>Liter → Ounces Conversions</p>	<p>Quick conversions to keep in mind</p>	<p>1 liter = 1,000 cc's = 1,000 ml's</p> <p>30 ml = 1 oz.</p> <p>240 ml = 8 oz. = 1 cup</p>
<p>How Many Ounces In:</p>	<p>Quick conversions to keep in mind</p>	<p>1 gallon = 128 oz.</p> <p>1 gallon = 4 quarts = 16 cups</p> <p>1 quart = 4 cups = 32 oz.</p> <p>1 cup = 8 oz.</p>
<p>How Many Meat Portions in a Pound</p>	<p>Quick conversions to keep in mind</p>	<p>1 lb. of raw meat = 16 oz.</p> <p>A standard protein portion is 4 oz. raw or 3 oz. cooked</p> <p>1 lb. of meat = four portions</p>
<p>How Many Portions in a #10 Can</p>	<p>Quick conversions to keep in mind</p>	<p>A #10 can = 12-13 cups of product</p> <p>A typical serving is 1/2 cup</p> <p>A #10 can = approximately 25 - 1/2 cup servings</p>
<p>Calculate the Scoop Size</p>	<p>Quick conversions to keep in mind</p>	<p>The scoop size is equal to the number of scoops in a quart (32 oz.)</p> <p>There are eight half-cups in a quart (#8 scoop)</p> <p>There are 12 one-third cups in a quart (#12 scoop)</p>
